SUMMARY

Backend engineer with 5+ years building distributed, multi-tenant microservices in Java/Spring Boot and Go. Redesigned a configurable approval-workflow platform for 30+ tenants and worked on a metrics platform handling 70M+ datapoints/min, with hands-on experience in system design tradeoffs, performance optimization, production support, and cloud security.

TECHNICAL SKILLS

Languages	Java 17/21, Go
Backend & Architecture	Spring Boot, Microservices, REST APIs, Distributed Systems, Multi-tenancy, Low-level & High-level Design
Data & Messaging	MySQL, PostgreSQL, Redis, Elasticsearch, Aerospike, Kafka, SQS
Cloud & DevOps	Kubernetes, Docker, AWS, Azure (Blob Storage, APIM), CI/CD
Observability & Tools	Datadog APM, Prometheus, Grafana, ELK, Git, IntelliJ IDEA, Cursor, Claude Code

EXPERIENCE

73 Strings — SDE II

Nov 2025 - Present

- Redesigned the approval workflow from a fixed flow into a configurable multi-level platform for 30+ tenants (entity-scoped access control, send-back to any prior level, audit-safe condition versioning); chose parallelized downstream calls and caching over sequential orchestration to cut p99 latency from ~900ms to ~350ms across 4-5 services.
- Handled production reliability, performance and security of multi-tenant services: root-caused incidents such as OOMKills using Datadog profiling, resolved latency and parallelism issues, and hardened Azure Blob Storage access.
- Built an AI-agent-based tool that upgrades legacy Java services (Java 8 and other versions to 21), modernizing 10+ repositories and cutting migration effort from ~1-2 weeks to 2-3 days per repo.
- Drove end-to-end delivery for the UAM and approval services (Spring Boot, MySQL, Elasticsearch, Kubernetes) — design, code review, and mentoring on changes to a multi-tenant platform, keeping releases maintainable and safe.

Sumo Logic — SDE II

Jun 2024 - Oct 2025

- Owned performance and reliability improvements on a metrics ingestion and query platform handling 70M+ datapoints/min, resolving day-to-day latency and parallelism issues.
- Changed the Kafka consumer partition assignment strategy to fix uneven partition distribution across pods during scaling (some consumers overloaded, others under-utilized), cutting ingestion-lag alerts from 2-3 per day to 5-6 per week.
- Reworked the in-memory data store to remove read/write lock contention by re-tuning and merging partitions, validated with benchmark, unit and e2e tests; queries now serve at real-time latency during ingestion lag instead of failing, with results trailing by the lag.

Open Financial Technologies — SDE

Sep 2022 - May 2024

- Built new microservices in Go on a common integration layer for core banking partners (IDFC, IndusInd, Axis) — alongside legacy Java services — processing 3-5K transactions/day with retries, idempotency keys to prevent duplicate transfers, and status checks for failed or delayed calls.
- Designed and launched the Axis Current Account onboarding service with integrated vKYC, cutting onboarding turnaround from ~1 week to ~2 hours and improving the customer acquisition pipeline.
- Automated fund-transfer and account-management operations, reducing related customer service inquiries by 15%.

Exotel — SDE

Sep 2021 - Sep 2022

- Designed a new Go-based microservice using ASR to select the best pilot number, handling ~700 calls/sec average (peaking higher at midday) across 20M+ calls/day concentrated in a 10am-6pm window; validated via POC before rollout, improving call pickup rate by 1.5%.
- Automated third-party API data integration (Java), reducing manual errors and improving database efficiency, with ELK-based logging for monitoring.
